

**Exercício 11:**

- Escrever um programa para alternar o estado dos LEDs **vermelho** e **verde** da placa MSP-EXP430G2 a cada 250ms.
- Inicialmente os LEDs deverão estar apagados;
- Sempre que a interrupção do pino **P1.3** (*Botão S2*) for ativada, o estado dos LEDs deverá alternar entre apagado e piscante;
- A temporização deverá ser feita através do *Timer0\_A*

Configurar a interrupção do pino P1.3 para a borda negativa.

## Vetores de Interrupções do MSP430G2553

## Interrupções das portas P1 e P2

Each pin in ports P1 and P2 have interrupt capability, configured with the PxIFG, PxIE, and PxIES registers. All P1 pins source a single interrupt vector, and all P2 pins source a different single interrupt vector. The PxIFG register can be tested to determine the source of a P1 or P2 interrupt.

Port	Register	Short Form	Address	Register Type	Initial State
P1	Input	P1IN	020h	Read only	–
	Output	P1OUT	021h	Read/write	Unchanged
	Direction	P1DIR	022h	Read/write	Reset with PUC
	Interrupt Flag	P1IFG	023h	Read/write	Reset with PUC
	Interrupt Edge Select	P1IES	024h	Read/write	Unchanged
	Interrupt Enable	P1IE	025h	Read/write	Reset with PUC
	Port Select	P1SEL	026h	Read/write	Reset with PUC
	Port Select 2	P1SEL2	041h	Read/write	Reset with PUC
	Resistor Enable	P1REN	027h	Read/write	Reset with PUC

## Interrupt Enable P1IE, P2IE

Each PxIE bit enables the associated PxIFG interrupt flag.

Bit = 0: The interrupt is disabled.

Bit = 1: The interrupt is enabled.

Interrupção do Pino *P1.3* habilitada

## Interrupt Edge Select Registers P1IES, P2IES

Each PxIES bit selects the interrupt edge for the corresponding I/O pin.

Bit = 0: The PxIFGx flag is set with a low-to-high transition

Bit = 1: The PxIFGx flag is set with a high-to-low transition

Interrupção do pino *P1.3* ativada na borda de descida

## **Interrupt Flag Registers P1IFG, P2IFG**

Each PxIFGx bit is the interrupt flag for its corresponding I/O pin and is set when the selected input signal edge occurs at the pin. All PxIFGx interrupt flags request an interrupt when their corresponding PxIE bit and the GIE bit are set. Each PxIFG flag must be reset with software. Software can also set each PxIFG flag, providing a way to generate a software initiated interrupt.

Bit = 0: No interrupt is pending

Bit = 1: An interrupt is pending

Only transitions, not static levels, cause interrupts. If any PxIFGx flag becomes set during a Px interrupt service routine, or is set after the RETI instruction of a Px interrupt service routine is executed, the set PxIFGx flag generates another interrupt. This ensures that each transition is acknowledged.

## Status Register (SR)

The status register (SR/R2), used as a source or destination register, can be used in the register mode only addressed with word instructions. The remaining combinations of addressing modes are used to support the constant generator. Figure 3–6 shows the SR bits.

→ GIE	General interrupt enable. This bit, when set, enables maskable interrupts. When reset, all maskable interrupts are disabled.
N	Negative bit. This bit is set when the result of a byte or word operation is negative and cleared when the result is not negative. Word operation: N is set to the value of bit 15 of the result Byte operation: N is set to the value of bit 7 of the result
Z	Zero bit. This bit is set when the result of a byte or word operation is 0 and cleared when the result is not 0.
C	Carry bit. This bit is set when the result of a byte or word operation produced a carry and cleared when no carry occurred.

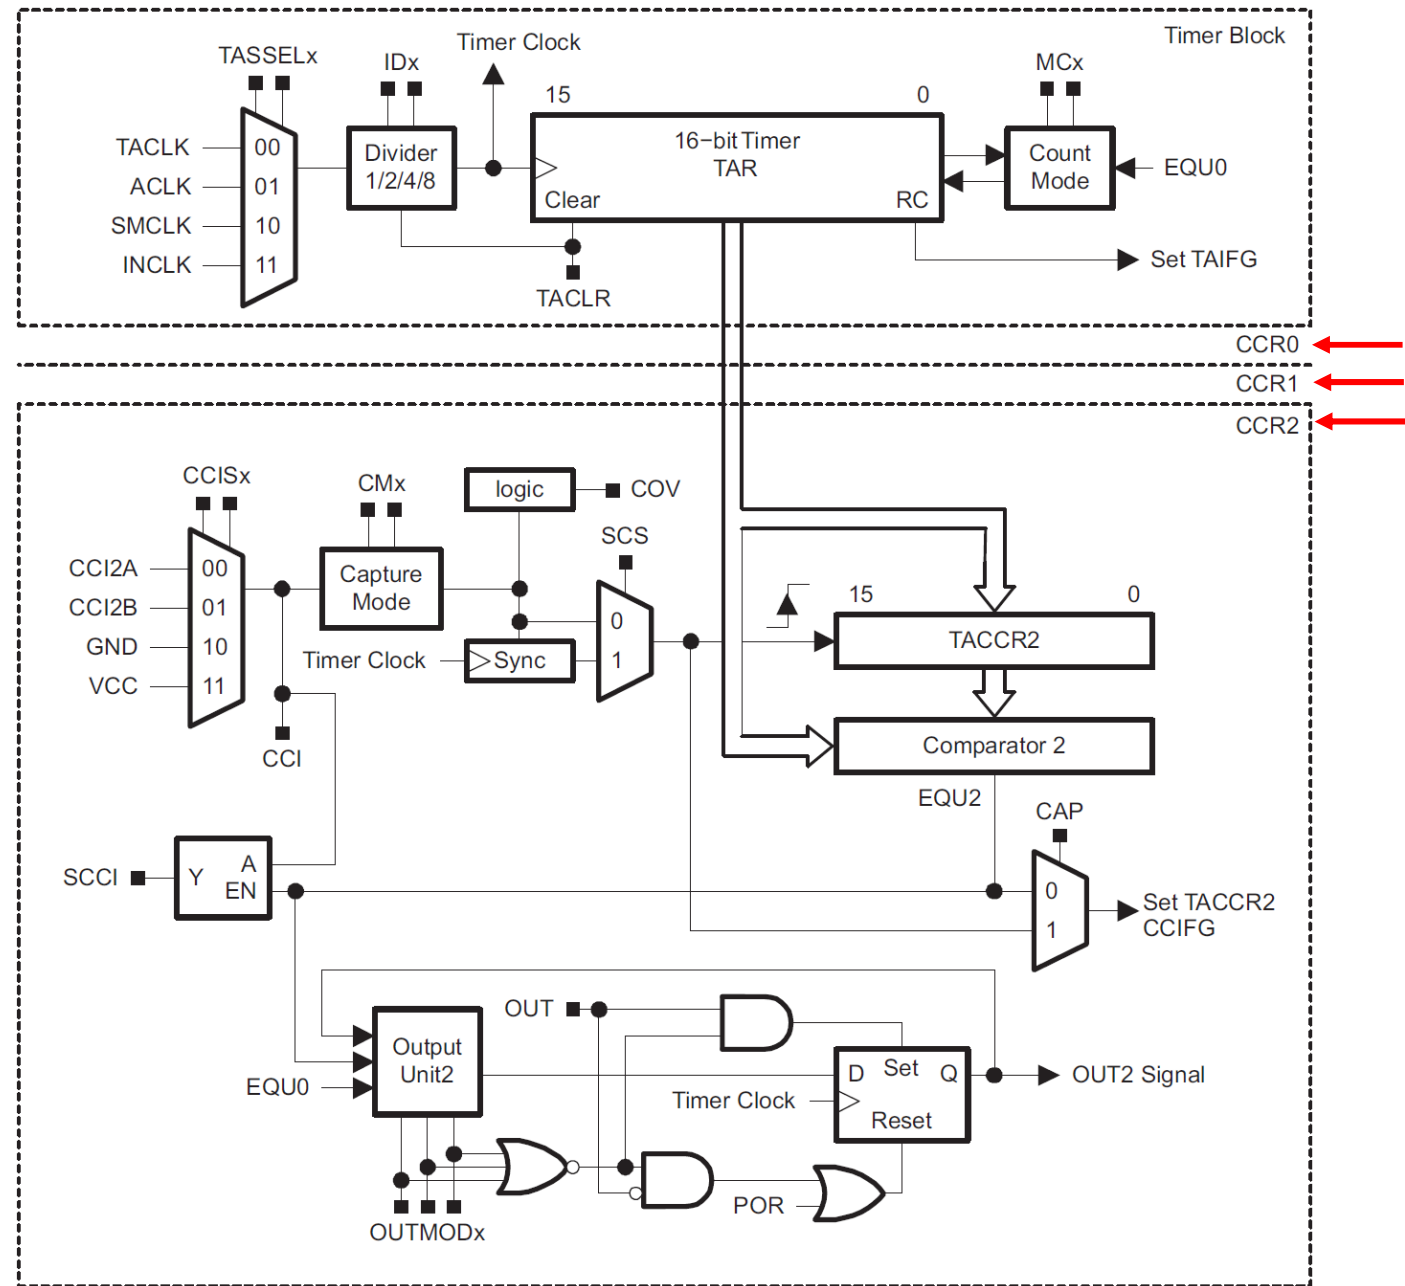

**Timer\_A:***Timer0\_A**Timer1\_A***Capture/Compare  
Blocks**

Table 12–3. Timer\_A Registers

Register	Short Form	Register Type	Address	Initial State
Timer_A control	TACTL	Read/write	0160h	Reset with POR
Timer_A counter	TAR	Read/write	0170h	Reset with POR
Timer_A capture/compare control 0	TACCTL0	Read/write	0162h	Reset with POR
Timer_A capture/compare 0	TACCR0	Read/write	0172h	Reset with POR
Timer_A capture/compare control 1	TACCTL1	Read/write	0164h	Reset with POR
Timer_A capture/compare 1	TACCR1	Read/write	0174h	Reset with POR
Timer_A capture/compare control 2	TACCTL2 <sup>†</sup>	Read/write	0166h	Reset with POR
Timer_A capture/compare 2	TACCR2 <sup>†</sup>	Read/write	0176h	Reset with POR
Timer_A interrupt vector	TAIV	Read only	012Eh	Reset with POR

<sup>†</sup> Not present on MSP430x20xx Devices

**Timer0\_A: TA0xxxxx**

**Timer1\_A: TA1xxxxx**

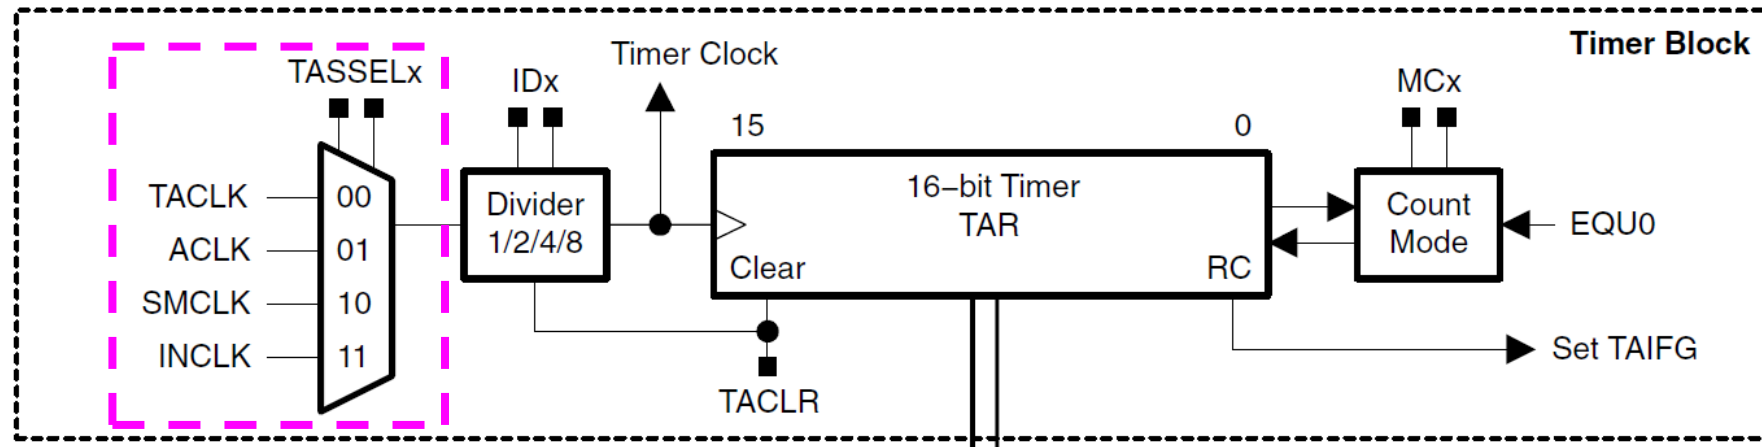

*Timer\_A: Contador de 16 bits*

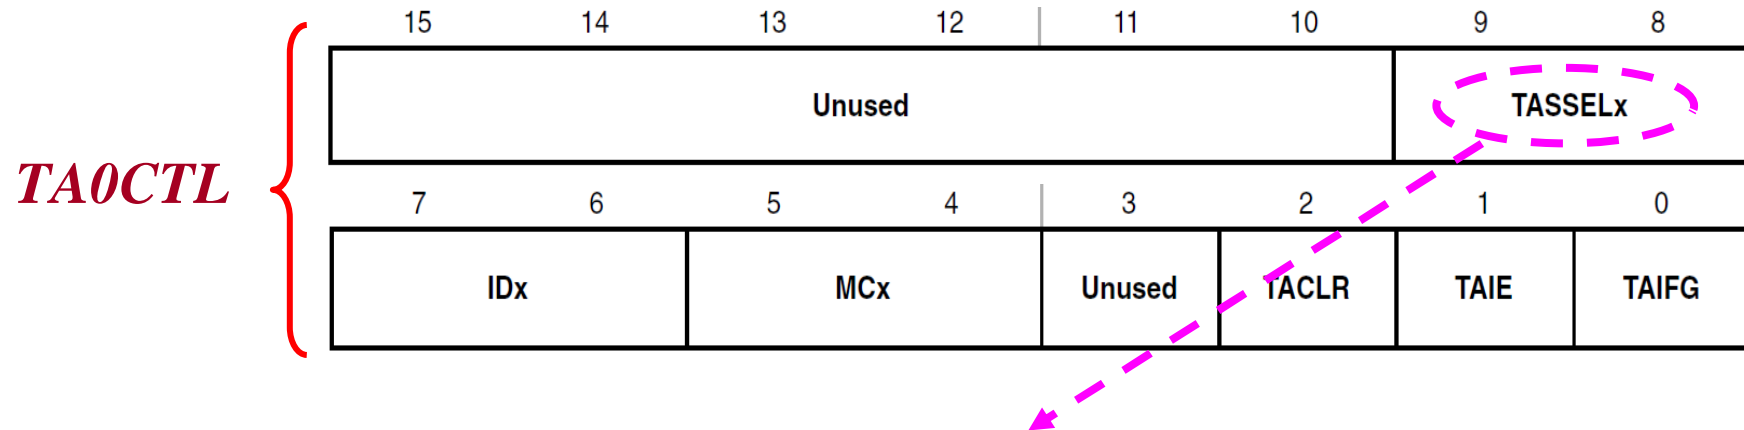

O *Contador* é incrementado à cada pulso de *Clock*

Se o pulso de *Clock* for periódico, tem-se um temporizador

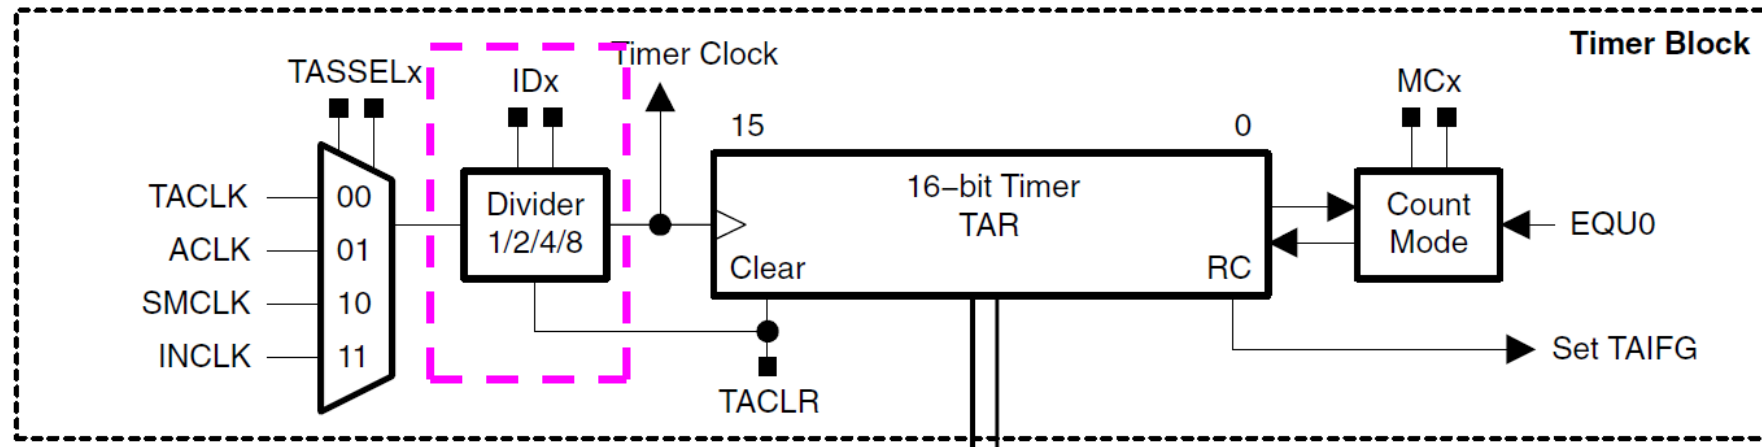

Se o pulso de *Clock* for aleatório, tem-se um contador

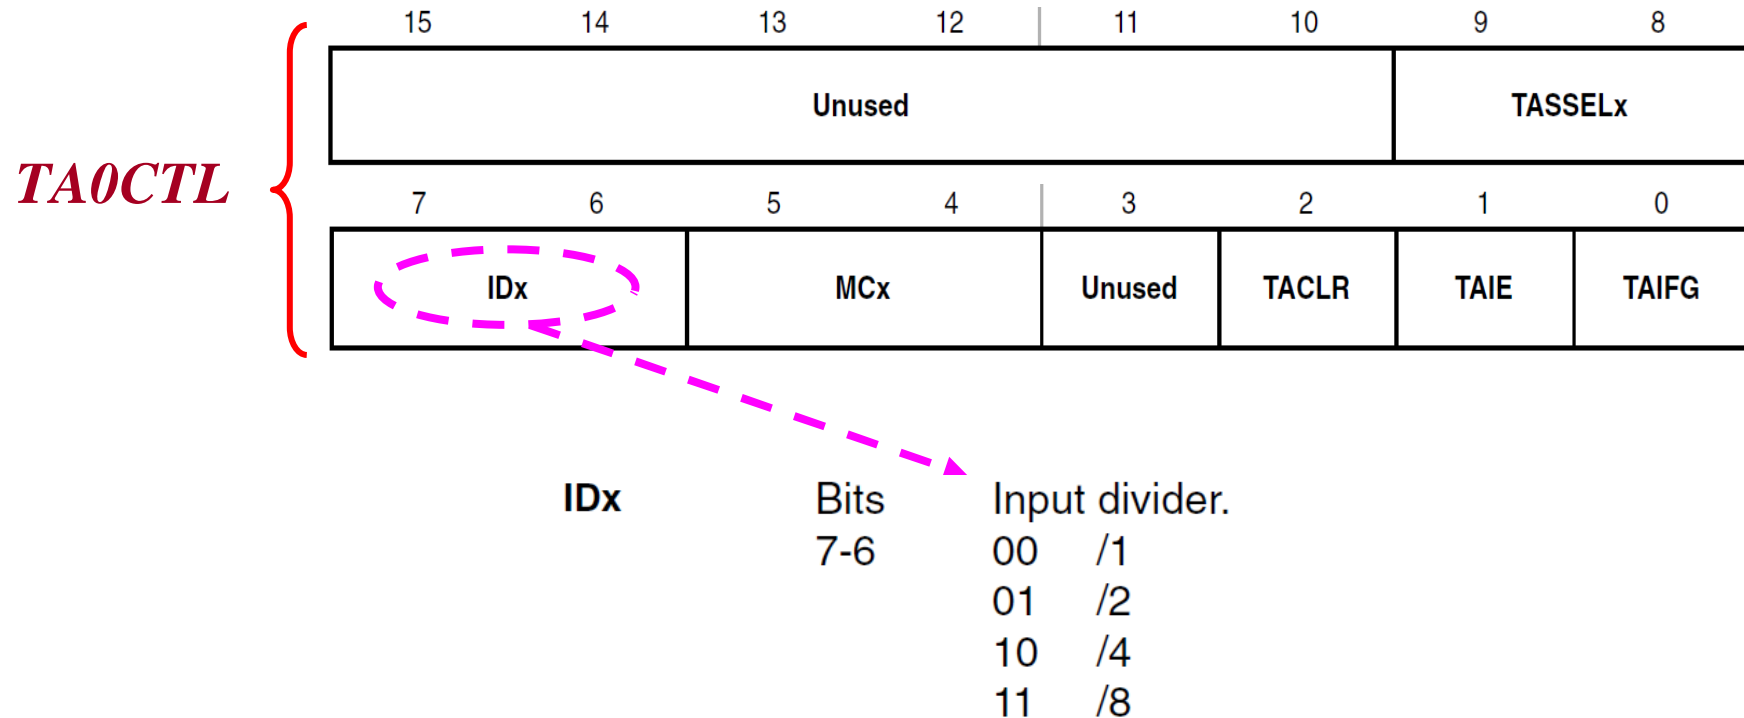

### Fontes de Clock para o *Timer\_A*

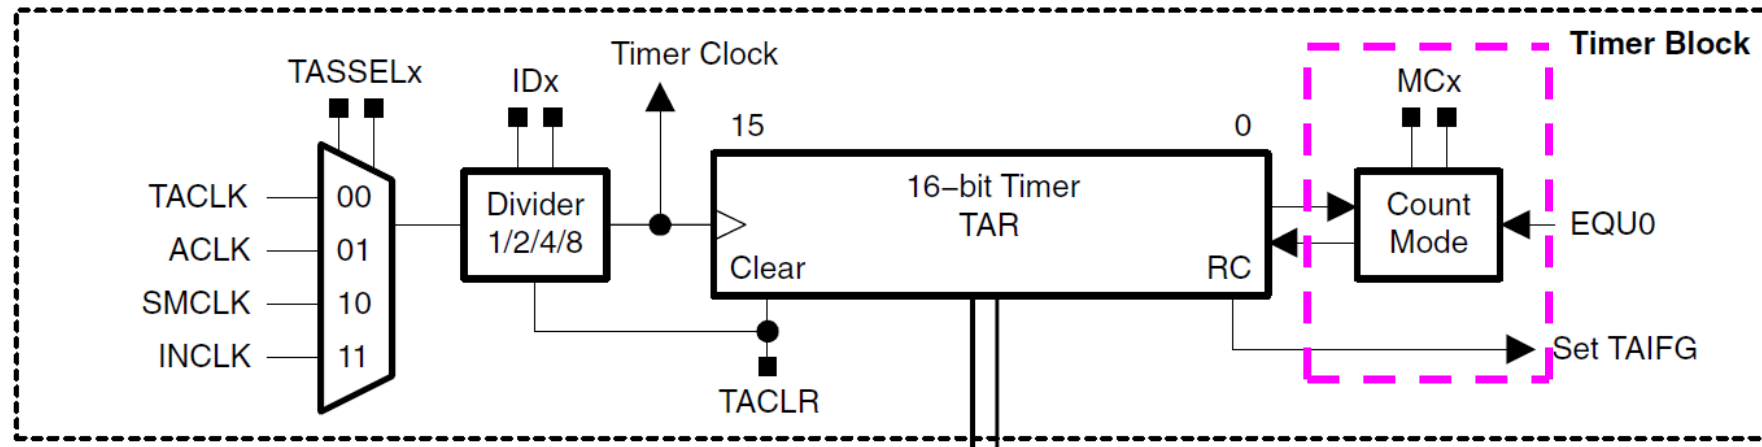

TASSELx	Bits	Timer_A clock source select
	9-8	
00		TACLK
01		ACLK
10		SMCLK
11		INCLK

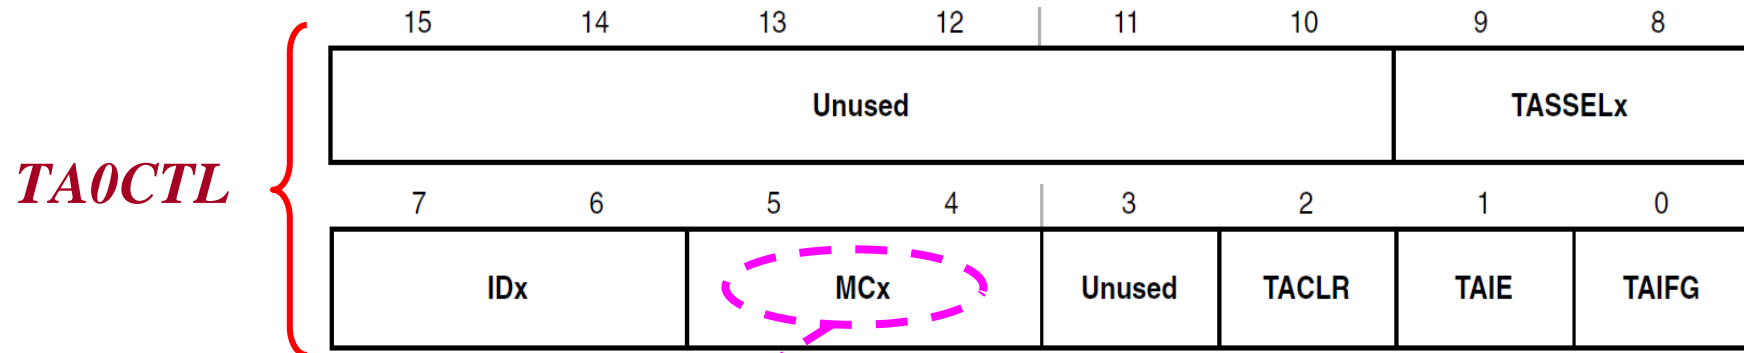

### Pre-Scaler (Divisor)

## Modo de Contagem

**MCx**

Bits  
5-4

Mode control. Setting MCx = 00h when Timer\_A is not in use conserves power.

00 Stop mode: the timer is halted.

01 Up mode: the timer counts up to TACCR0.

10 Continuous mode: the timer counts up to 0FFFFh.

11 Up/down mode: the timer counts up to TACCR0 then down to 0000h.

## 12.3.1 TACTL, Timer\_A Control Register

Unused	Bits 15-10	Unused
TASSELx	Bits 9-8	Timer_A clock source select
		00 TACLK
		01 ACLK
		10 SMCLK
		11 INCLK (INCLK is device-specific and is often assigned to the inverted TBCLK) (see the device-specific data sheet)
IDx	Bits 7-6	Input divider. These bits select the divider for the input clock.
		00 /1
		01 /2
		10 /4
		11 /8
MCx	Bits 5-4	Mode control. Setting MCx = 00h when Timer_A is not in use conserves power.
		00 Stop mode: the timer is halted.
		01 Up mode: the timer counts up to TACCR0.
		10 Continuous mode: the timer counts up to 0FFFFh.
		11 Up/down mode: the timer counts up to TACCR0 then down to 0000h.
Unused	Bit 3	Unused
TACLR	Bit 2	Timer_A clear. Setting this bit resets TAR, the clock divider, and the count direction. The TACLR bit is automatically reset and is always read as zero.
TAIE	Bit 1	Timer_A interrupt enable. This bit enables the TAIFG interrupt request.
		0 Interrupt disabled
		1 Interrupt enabled
TAIFG	Bit 0	Timer_A interrupt flag
		0 No interrupt pending
		1 Interrupt pending

## Modos de Contagem

O modo *Up* é utilizado quando o período do *Timer* for diferente de 0xFFFF.

O *Timer* conta repetidamente até o valor armazenado no Registrador *TACCR0*.

Quando o *Timer* atinge o valor de comparação armazenado no Registrador *TACCR0*, a contagem é reiniciada a partir de zero.

A *flag* de interrupção *CCIFG* (registrador *TACCTL0*) é setada quando o *Timer* atinge o valor de comparação armazenado no Registrador *TACCR0*.

A *flag* de interrupção *TAIFG* (registrador *TACTL*) é setada quando o *Timer* passa do valor de comparação armazenado no Registrador *TACCR0* para zero.

## Modos de Contagem

O *Timer* conta repetidamente até 0xFFFF. Quando o *Timer* atinge 0xFFFF, a contagem é reiniciada a partir de zero.

A *flag* de interrupção *TAIFG* (registrador *TACTL*) é setada quando o *Timer* passa de 0xFFFF para zero.

## Modos de Contagem

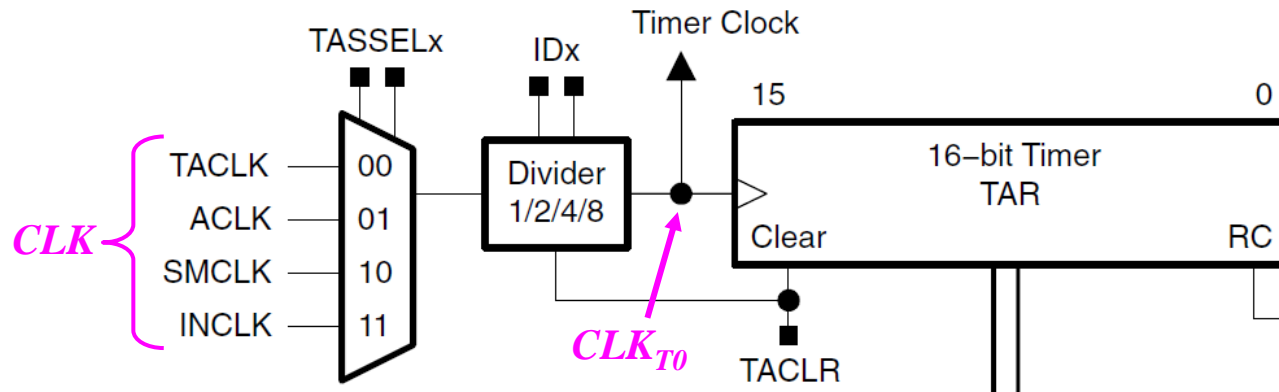

O *Timer* conta repetidamente de modo ascendente até o valor de comparação armazenado no Registrador *TACCR0* zero.

Quando atinge o valor de comparação (*TACCR0*) o *Timer* passa a contar de modo descendente até zero.

A *flag* de interrupção *CCIFG* é setada quando o *Timer* atinge o valor armazenado no Registrador de comparação *TACCR0*.

A *flag* de interrupção *CCIFG* é setada quando o *Timer* atinge o valor zero.

Configuração do *clock* para o *TIMER0\_A*

$$CLK_{T0} = CLK / div$$

**Tempo para incrementar o *Timer0* (Período):**

$$T_{T0} = 1 / CLK_{T0} = 1 / (CLK / div) = div / CLK$$

**Considerando  $CLK = SMCLK$  e  $DCO = 1\text{ MHz}$ :**

$$T_{T0} = div / 1.10^6 = div \times 10^{-6} = div \text{ } \mu\text{s}$$

$$div = 1 \rightarrow T_{T0} = 1 \text{ } \mu\text{s}$$

$$div = 2 \rightarrow T_{T0} = 2 \text{ } \mu\text{s}$$

$$div = 4 \rightarrow T_{T0} = 4 \text{ } \mu\text{s}$$

$$div = 8 \rightarrow T_{T0} = 8 \text{ } \mu\text{s}$$

Número de incrementos do *Timer* necessários para temporizar 250ms

Considerando  $div = 4 \rightarrow T_{T0} = 4 \mu s$

Para temporizar  $t \mu s \rightarrow 4 \times N \mu s$ :

$N$ : número de incrementos do *Timer*

$$250000 = 4 \times N \longrightarrow N = 62500$$

### 12.3.2 TAR, Timer\_A Register

15	14	13	12	11	10	9	8
TARx							
rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)
7	6	5	4	3	2	1	0
TARx							
rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)

**TARx** Bits 15-0 Timer\_A register. The TAR register is the count of Timer\_A.

### 12.3.3 TACCRx, Timer\_A Capture/Compare Register x *TA0CCR0*

15	14	13	12	11	10	9	8
TACCRx							
rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)
7	6	5	4	3	2	1	0
TACCRx							
rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)	rw-(0)

**TACCRx** Bits 15-0 Timer\_A capture/compare register.

Compare mode: TACCRx holds the data for the comparison to the timer value in the Timer\_A Register, TAR.

Capture mode: The Timer\_A Register, TAR, is copied into the TACCRx register when a capture is performed.

12.3.4 TACCTLx, Capture/Compare Control Register *TA0CCTL0*

15	14	13	12	11	10	9	8
<b>CMx</b>		<b>CCISx</b>		<b>SCS</b>	<b>SCCI</b>	<b>Unused</b>	<b>CAP</b>

7	6	5	4	3	2	1	0
<b>OUTMODx</b>				<b>CCIE</b>	<b>CCI</b>	<b>OUT</b>	<b>COV</b>
							<b>CCIFG</b>

<b>CMx</b>	Bit 15-14	Capture mode	
		00	No capture
		01	Capture on rising edge
		10	Capture on falling edge
		11	Capture on both rising and falling edges
<b>CCISx</b>	Bit 13-12	Capture/compare input select. These bits select the TACCRx input signal. See the device-specific data sheet for specific signal connections.	
		00	CClxA
		01	CClxB
		10	GND
		11	V <sub>CC</sub>
<b>SCS</b>	Bit 11	Synchronize capture source. This bit is used to synchronize the capture input signal with the timer clock.	
		0	Asynchronous capture
		1	Synchronous capture
<b>SCCI</b>	Bit 10	Synchronized capture/compare input. The selected CCI input signal is latched with the EQUx signal and can be read via this bit	
<b>Unused</b>	Bit 9	Unused. Read only. Always read as 0.	
<b>CAP</b>	Bit 8	Capture mode	
		0	Compare mode
		1	Capture mode

## 12.3.4 TACCTLx, Capture/Compare Control Register

*TA0CTL0*

15	14	13	12	11	10	9	8
<b>CMx</b>		<b>CCISx</b>		<b>SCS</b>	<b>SCCI</b>	<b>Unused</b>	<b>CAP</b>
rw-(0)		rw-(0)		rw-(0)	r	r0	rw-(0)
7	6	5	4	3	2	1	0
<b>OUTMODx</b>			<b>CCIE</b>	<b>CCI</b>	<b>OUT</b>	<b>COV</b>	<b>CCIFG</b>

<b>OUTMODx</b>	Bits 7-5	Output mode. Modes 2, 3, 6, and 7 are not useful for TACCR0, because EQUx = EQU0.
		000 OUT bit value
		001 Set
		010 Toggle/reset
		011 Set/reset
		100 Toggle
		101 Reset
		110 Toggle/set
		111 Reset/set
<b>CCIE</b>	Bit 4	Capture/compare interrupt enable. This bit enables the interrupt request of the corresponding CCIFG flag.
		0 Interrupt disabled
		1 Interrupt enabled
<b>CCI</b>	Bit 3	Capture/compare input. The selected input signal can be read by this bit.
<b>OUT</b>	Bit 2	Output. For output mode 0, this bit directly controls the state of the output.
		0 Output low
		1 Output high
<b>COV</b>	Bit 1	Capture overflow. This bit indicates a capture overflow occurred. COV must be reset with software.
		0 No capture overflow occurred
		1 Capture overflow occurred
<b>CCIFG</b>	Bit 0	Capture/compare interrupt flag
		0 No interrupt pending
		1 Interrupt pending
